

The **Velivr'** Project

Duration

10 months (Sept. 2018 – Jul. 2019)

Objective

- Identification of the **problem of cycling** under the influence of alcohol and/or drugs (**CUI**) and indication of its **magnitude**
- Observation and analysis of the **behavior** of the persons concerned
- Identification of **factors of risk** behavior

Methodology

- Rules and data concerning CUI were recorded through a **survey** among IRTAD countries
- A total of **14 IRTAD members** responded to the survey
- **Results** from the survey have been reported "**by topic**" and for each topic of the questionnaire aggregated results are provided

Impact

Safe cycling attracts growing attention

The need for **cycling skills** is partially recognized as implied by the minimum age restrictions

The **vulnerability** of cyclists is not fully realised

The **CUI problem** is not appropriately addressed
