

Structural Condition Assessment of Asphalt Pavements in the Framework of Major Maintenance of Attiki Odos at the End of the Warranty Period

Scientific Responsible
Professor **Andreas Loizos**

Following the completion of the heavy maintenance works on the pavements of Attiki Odos, which primarily involved the replacement of the anti-skid asphalt wearing course, the research team of the Pavement Engineering Laboratory of the National Technical University of Athens (NTUA) will contribute to the inspection and documentation of the structural condition quality of the respective pavements at the end of the Warranty Period, as defined in the Concession Agreement.

It is noted that the NTUA Pavement Engineering Laboratory, in addition to conventional systems for conducting laboratory material tests and inspections, is equipped with advanced Non-Destructive Testing (NDT) systems utilizing state-of-the-art technology for in-situ pavement condition assessment. The Laboratory also possesses the necessary expertise for the analysis of collected data to evaluate both the structural and functional condition of pavements.
